CVE-2025-66200	✖	2025-12-05	Apache Software Foundation	mod_userdir+suexec bypass via AllowOverride FileInfo vulnerability in Apache HTTP Server. Users with access to use the RequestHeader directive in htaccess can cause some CGI scripts to run under an unexpected userid. This issue affects Apache HTTP Server: from 2.4.7 through 2.4.65. Users are recom...
CVE-2025-65082	✖	2025-12-05	Apache Software Foundation	Improper Neutralization of Escape, Meta, or Control Sequences vulnerability in Apache HTTP Server through environment variables set via the Apache configuration unexpectedly superseding variables calculated by the server for CGI programs. This issue affects Apache HTTP Server from 2.4.0 through 2.4...
CVE-2025-59775	✖	2025-12-05	Apache Software Foundation	Server-Side Request Forgery (SSRF) vulnerability in Apache HTTP Server on Windows with AllowEncodedSlashes On and MergeSlashes Off allows to potentially leak NTLM hashes to a malicious server via SSRF and malicious requests or content Users are recommended to upgrade to version 2.4.66, which...
CVE-2025-58098	✖	2025-12-05	Apache Software Foundation	Apache HTTP Server 2.4.65 and earlier with Server Side Includes (SSI) enabled and mod_cgid (but not mod_cgi) passes the shell-escaped query string to #exec cmd="..." directives. This issue affects Apache HTTP Server before 2.4.66. Users are recommended to upgrade to version 2.4.66, which fixes the...
CVE-2025-55753	✖	2025-12-05	Apache Software Foundation	An integer overflow in the case of failed ACME certificate renewal leads, after a number of failures (~30 days in default configurations), to the backoff timer becoming 0. Attempts to renew the certificate then are repeated without delays until it succeeds. This issue affects Apache HTTP Server: fr...

Esta versión de apache cuenta con múltiples problemas de seguridad, algunos listados y reportados son:

Vulnerabilidades en el uso conjunto de dos modulos “mod_userdir” junto con “suexec” lo que permitia que si un usuario lograba tener acceso para usar un RequestHeader, dentro de los archivos de acceso de http, podia ejecutar scripts con otro user ID permitiendo incluso el escalar privilegios.

Otra de las vulnerabilidades eran la inyección de variables, lo cual permitia manipular datos en el servidor.

Por agregar otra problematica de esta version, es el la posibilidad de realizar un integer overflow, el cual esta relacionado con los certificados de SSL, al no poder renovar un certificado debido a que se podía romper el temporizador de renovación, podia generar un DoS por agotamiento de recursos, al estar constantemente intentando renovar el certificado.
